--> Comment Text :
In my opinion, your major approach is ill-founded.

Please seriously consider finding the closest(closest to the
surface and within U.S. territory) active geologic
'Subduction Zone' within the 200 mile U.S. seacoast Territorial
Limit and research existing or new technology to place the
high level waste down in that area so that it may be
recycled into the earths mantle by natural geologic processes.
Current oil well drilling technology should certainly
be up to the task and would be much more cost effective.
The well-heads could even be onshore.
